

Building systems that survive growth, change, and pressure.

I am Artsiom Hontar, an AI engineer with a deep backend, platform, and architecture background. I design distributed systems, cloud platforms, and practical AI workflows that make complex engineering work more understandable and more reliable.

- Madrid
- 8+ years engineering
- Backend · platform · architecture
- AI-assisted systems

650k+ engineers served by an engineering intelligence platform	120+ production microservices across hybrid AWS and on-premise infrastructure
95% observability cost reduction through platform replacement and simplification	80% reduction in core pipeline failures through persistent execution tracking

01 • EXPERIENCE

Technical leadership with production consequences.

My work sits between system design and the operational details that decide whether a system remains useful after launch.

01

ACCURIS TECH • FORMERLY S&P GLOBAL

2020 – present

Staff Software Engineer · Technical Lead · Platform / Solutions Architect

Technical lead for a distributed engineering intelligence ecosystem serving more than 650,000 engineers, with 2M+ engineering standards and millions of patent documents across hybrid AWS and on-premise infrastructure.

- Owned architecture, technical research, system design, and feature decomposition for a core backend team within a 40+ engineer organization.
- Designed backend services, BFF components, migration adapters, distributed processing pipelines, and ML-integrated APIs for a product suite contributing approximately \$8M in ARR.
- Re-architected event-driven orchestration with persistent execution tracking and workload-aware scaling, reducing production pipeline failures by 80%.
- Led the migration from on-premise infrastructure to AWS across application, data, and deployment layers, moving from bi-weekly blue/green releases to automated canary delivery.
- Reduced observability costs by more than 95% by replacing legacy Elastic infrastructure with Grafana, Prometheus, Loki, OpenTelemetry, and distributed tracing.
- Defined platform standards, golden paths, service templates, Helm charts, and deployment workflows for 120+ services across two production EKS clusters and 16 namespaces.

02

NDB

2019 — 2020

Senior Software Engineer • Acting Technical Lead

Core engineer in a greenfield B2B neo-banking and lending platform for BRICS-region markets, delivered as a production fintech product under a one-year launch target.

- Owned Camunda BPM architecture across eight core financial workflows, including a conditional 30-step lending pipeline.
- Reduced stalled or blocked workflow incidents from more than 200 per week to near zero through process redesign and backend fixes.
- Designed APIs for loan origination, customer onboarding, compliance workflows, and secure OTP authentication.
- Led a backend sub-team of three engineers, coordinating design decisions, code reviews, estimates, and delivery with client CTO leadership.

03

AZAKAW

2018 — 2019

Software Engineer • Platform and backend delivery

Contributed to a fintech compliance platform covering AML, KYC, risk assessment, and regulatory customer onboarding.

- Built onboarding and verification workflows with .NET, TypeScript, Angular, MS SQL, and Couchbase.
- Re-architected identity and authentication flows, doubling login performance while improving session security.
- Raised automated test coverage by approximately 50% and supported production-readiness improvements.

04

SIBINTEK

2018

Junior Software Engineer

Worked on a legacy enterprise information system for corporate property and asset management.

02 • CAPABILITIES

The shape of the work.

The tools change by context. The engineering concerns stay consistent: clarity, feedback, resilience, and a measurable path from decision to outcome.

A

Backend architecture

C#, .NET, TypeScript, Node.js, Python, APIs, microservices, event-driven systems, BFFs, and integration design.

B

Cloud and platform

AWS, EKS, Kubernetes, Docker, Terraform, Helm, OpenShift, CI/CD, golden paths, and developer self-service.

C

Reliability and economics

Observability, distributed tracing, workload-aware scaling, incident reduction, cost control, and production readiness.

D

AI systems

Agent workflows, context engineering, MCP, model and harness trade-offs, evaluation, and AI-assisted delivery loops.

03 • INDEPENDENT WORK

Making ideas survive contact with production.

Independent projects are where I test architecture choices end to end, from product shape and API contracts to deployment, billing, and user feedback.

AI PRODUCT · 2026

Yomio

A cross-platform AI expense application with receipt OCR, spending insights, chat assistance, subscriptions, authentication, analytics, and cloud infrastructure.

2,000+ registered users · 150 paid subscribers

AGENT ENGINEERING

AgentsGang

An experimental agent engine exploring planning, execution graphs, MCP tools, memory, and orchestration patterns for practical workflows.

RESEARCH AND PUBLISHING

Token Economy

A research article and presentation on model routing, harness cost, context, caching, compression, observability, and verified work per dollar.

04 · CREDENTIALS

Continuous learning, grounded in delivery.

Certification records consolidated from the three CV versions. Public Credly verification is linked where the badge is visible on the public profile.

AWS Certified Solutions Architect — Professional

19 Jun 2026 · AWS

AWS Certified Generative AI Developer — Professional

04 Jun 2026 · AWS

Claude Certified Architect — Professional

25 Jul 2026 · Anthropic

AWS Certified Machine Learning Engineer — Associate

20 Feb 2026 · AWS

AWS Certified Solutions Architect — Associate
